We know our stuff!

So, what is ultimate?

- Smallest
- Fatsest startup
- Something inbetween

So, let's look at all of them!

How do we create an image?

Let's start from trivial.

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT     java -jar /app/build/libs/spring-petclinic*.jar
```

How do we create an image?

Let’s start from trivial.

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT     java -jar /app/build/libs/spring-petclinic*.jar
```

How do we create an image?

Let’s start from trivial.

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT     java -jar /app/build/libs/spring-petclinic*.jar
```

How do we create an image?

Let’s start from trivial.

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT     java -jar /app/build/libs/spring-petclinic*.jar
```

How do we create an image?

Let's start from trivial.

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT     java -jar /app/build/libs/spring-petclinic*.jar
```

`Dockerfile` directives

1. Each directive creates a layer of the image.
2. Layers are *immutable*
3. Some layers are zero-sized

`Dockerfile` directives

1. Each directive creates a layer of the image.
2. Layers are *immutable*
3. Some layers are zero-sized

```
FROM bash

COPY . /app
RUN rm -rf /app
```

`Dockerfile` directives

1. Each directive creates a layer of the image.
2. Layers are *immutable*
3. Some layers are zero-sized

```
FROM bash

COPY . /app
RUN rm -rf /app
```

`Dockerfile` directives

1. Each directive creates a layer of the image.
2. Layers are *immutable*
3. Some layers are zero-sized (for example `RUN rm -rf /app`)

```
FROM bash

COPY . /app
RUN rm -rf /app
```

`Dockerfile` directives

1. Each directive creates a layer of the image.
2. Layers are *immutable*
3. Some layers are zero-sized (for example `RUN rm -rf /app`)

```
FROM bash

COPY . /app
RUN rm -rf /app
```

4. We would like image to be light, but it’s not :(

Our `Dockerfile`

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT java -jar /app/build/libs/spring-petclinic*.jar
```

Our `Dockerfile`

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT java -jar /app/build/libs/spring-petclinic*.jar
```

Our `Dockerfile`

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT java -jar /app/build/libs/spring-petclinic*.jar
```

Our `Dockerfile`

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT java -jar /app/build/libs/spring-petclinic*.jar
```

Result

```

579.44 MB are changed on every build!

Why do we care? We care because:

1. `push` takes longer time to start (update is longer)
2. `pull` takes longer (update takes longer & scaling takes longer)

Also, more disk psace is inefficiently used

Optimizing. Round 1.

Let’s build it outside of container

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY . /app
RUN cd /app && ./gradlew build
ENTRYPOINT java -jar /app/build/libs/spring-petclinic*.jar
```

Optimizing. Round 1.

Let’s build it outside of container

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY build/libs/spring-petclinic-3.3.0.jar /app/app.jar
CMD java -jar /app/app.jar
```

Optimizing. Round 1.

Let’s build it outside of container

```
FROM bellsoft/liberica-runtime-container:jdk-21.0.3_10-musl

COPY build/libs/spring-petclinic-3.3.0.jar /app/app.jar
CMD java -jar /app/app.jar
```

Just copying the prebuilt `jar` file

Results

```

Saved 500+ MB

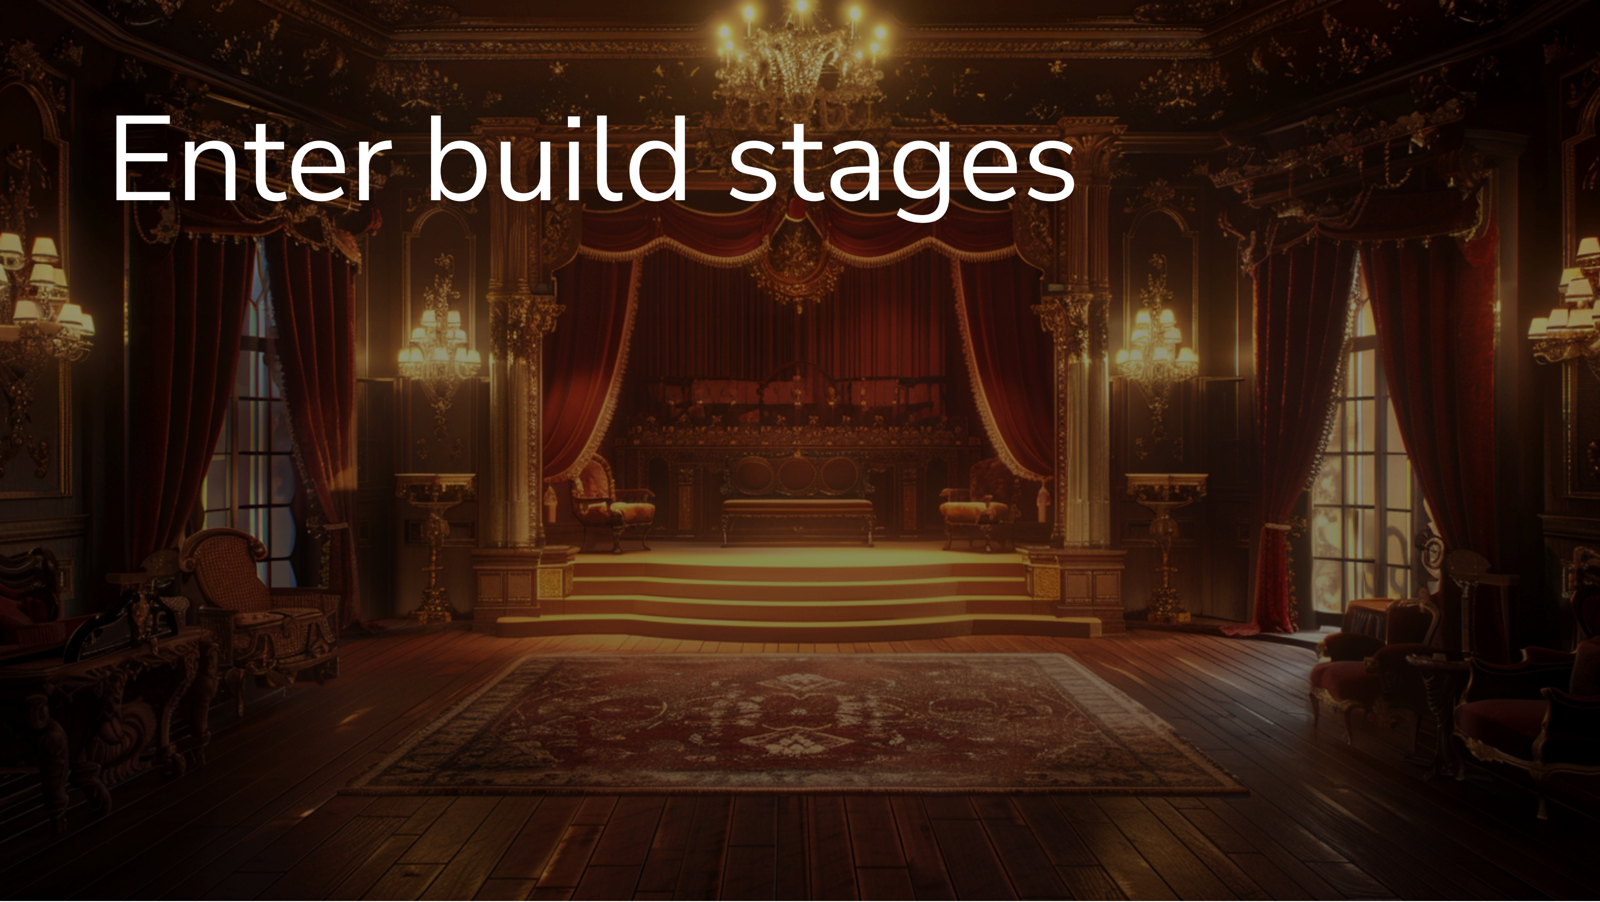
But the build is not clean now :(

Saved 500+ MB

But the build is not clean now :(

We have to build everything outside, what if environment affects the build?

Enter build stages



Multi-stage builds

Holy grail of pure builds

- Allow clean builds
- Allow optimal packaging
- Allow different base images

Staged example

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build -xtest

FROM bellsoft/liberica-runtime-container:jre-slim-musl as runner

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
```

Pasha Finkelshteyn @asm0di0

Staged example

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build -xtest

FROM bellsoft/liberica-runtime-container:jre-slim-musl as runner

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
```

Staged example

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build -xtest

FROM bellsoft/liberica-runtime-container:jre-slim-musl as runner

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
```

Staged example

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build -xtest

FROM bellsoft/liberica-runtime-container:jre-slim-musl as runner

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
```

Staged example

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build -xtest

FROM bellsoft/liberica-runtime-container:jre-slim-musl as runner

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
```

Staged example

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build -xtest

FROM bellsoft/liberica-runtime-container:jre-slim-musl as runner

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
```

Result

```

- Introduce new "optimizer" stage
- Extract the jar to layered structure
- Copy layers

Layers

Because Spring Boot jar is complex!

```
Usage:
  java -Djarmode=tools -jar my-app.jar

Available commands:
  extract      Extract the contents from the jar
  list-layers  List layers from the jar that can be extracted
```

Layers

```

- Dependencies: ~57.7MiB
- Launcher: 382.56kiB
- Application: ~3MiB

Together: ~61MiB

61.0MiB > 58.8Mib!

😱

What are we optimizing?

Pull size!

Pull size here is usually only around 3MiB!

We just reinvented how the BellSoft's buildpack works!

And it is amazing

Diversion: buildpacks

https://paketo.io/

Trivial usage:

```
/usr/sbin/pack build petclinic \
  --builder bellsoft/buildpacks.builder \
  --path . \
  -e BP_JVM_VERSION=21
```

Diversion: buildpacks

https://paketo.io/

Trivial usage:

```
/usr/sbin/pack build petclinic \
  --builder bellsoft/buildpacks.builder \
  --path . \
  -e BP_JVM_VERSION=21
```

Diversion: buildpacks

Buildpacks

Why do we need them?

> - Buildpacks transform your application source code into container images
> - The Paketo open source project provides production-ready buildpacks for the most popular languages and frameworks
> - Use Paketo Buildpacks to easily build your apps and keep them updated

- Reminds of s2i images
- Build better than default
- Spring-aware

Is this all?

We’ve optimized pull/push size, right?

Optimization is multidimensional

When startup time is more important…

There are several solutions for the Spring application startup time

1. Class Data Sharing (CDS)
2. Coordinated Restore at Checkpoint
3. Native Image

Class Data Sharing (CDS)

- **When**: Java 5 (!)
- **Why**: reduce the startup and memory footprint of multiple JVM instances running on the same host
- **How**: stores data in an archive

How does it help us?

Class Data Sharing (CDS)

- **When**: Java 5 (!)
- **Why**: reduce the startup and memory footprint of multiple JVM instances running on the same host
- **How**: stores data in an archive

How does it help us?

It does not! 🧌

Class Data Sharing (CDS)

- **When**: Java 5 (!)
- **Why**: reduce the startup and memory footprint of multiple JVM instances running on the same host
- **How**: stores data in an archive

How does it help us?

It does not! 🧟But

Application Class Data Sharing

- **When**: Java 10
- **Why**: add application classes to the archive

And then:

- **When**: Java 13, JEP 350
- **Why**: allow addition of classes into the archive upon app exit!

And this helps! How?

How to use AppCDS with Spring?

- `-XX:ArchiveClassesAtExit=application.jsa` to create an archive
- `-Dspring.context.exit=onRefresh` to start and immediately exit the application

NB:

1. Use the same JDK
2. Use the same arguments

And even better!

Spring AOT

Add `-Dspring.aot.enabled=true`

Even more classes!!!

What does it cost ?

```
1    -r--r--r--          0:0       81 MB ├── application.jsa
```

Which is not small at all!

What does it cost ?

```
-r--r--r--          0:0       81 MB  ├── application.jsa
```

Which is not small at all!

But you're trading pull speed for startup speed

How much faster?

Up to 50-60%

Pushing further with CRaC

CRaC: Coordinated Restore at Checkpoint

> The CRaC (Coordinated Restore at Checkpoint) Project researches coordination of Java programs with mechanisms to checkpoint (make an image of, snapshot) a Java instance while it is executing. Restoring from the image could be a solution to some of the problems with the start-up and warm-up times. The primary aim of the Project is to develop a new standard mechanism-agnostic API to notify Java programs about the checkpoint and restore events. Other research activities will include, but will not be limited to, integration with existing checkpoint/restore mechanisms and development of new ones, changes to JVM and JDK to make images smaller and ensure they are correct.

https://openjdk.org/projects/crac/

Pasha Finkelshteyn @asm0di0

In a perfect world it should be:

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build

FROM bellsoft/liberica-runtime-container:jre-crac-slim as optimizer

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
WORKDIR /app
RUN java -Dspring.context.checkpoint=onRefresh -XX:CRaCCheckpointTo=/checkpoint -jar /app/ap

FROM bellsoft/liberica-runtime-container:jre-crac-slim as runner

ENTRYPOINT java -XX:CRaCRestoreFrom=/checkpoint
COPY --from=optimizer /app/app.jar /app/app.jar
COPY --from=optimizer /checkpoint /checkpoint
```

In a perfect world it should be:

```
FROM bellsoft/liberica-runtime-container:jdk-musl as builder

COPY . /app
RUN cd /app && ./gradlew build

FROM bellsoft/liberica-runtime-container:jre-crac-slim as optimizer

COPY --from=builder /app/build/libs/spring-petclinic-3.3.0.jar /app/app.jar
WORKDIR /app
RUN java -Dspring.context.checkpoint=onRefresh -XX:CRaCCheckpointTo=/checkpoint -jar /app/ap

FROM bellsoft/liberica-runtime-container:jre-crac-slim as runner

How to make it better?

1. Build JAR (in docker or not)
2. Create new image that will run the JAR with CRaC arguments in `ENTRYPOINT`
3. Run the container with capabilities:
    1. CAP_SYS_PTRACE

How to make it better?

1. Build JAR (in docker or not)
2. Create new image that will run the JAR with CRaC arguments in `ENTRYPOINT`
3. Run the container with capabilities:
   1. CAP_SYS_PTRACE
   2. CAP_CHECKPOINT_RESTORE

How to make it better?

1. Build JAR (in docker or not)
2. Create new image that will run the JAR with CRaC arguments in `ENTRYPOINT`
3. Run the container with capabilities:
   1. CAP_SYS_PTRACE
   2. CAP_CHECKPOINT_RESTORE
4. Container will run and stop

How to make it better?

1. Build JAR (in docker or not)
2. Create new image that will run the JAR with CRaC arguments in `ENTRYPOINT`
3. Run the container with capabilities:
   1. CAP_SYS_PTRACE
   2. CAP_CHECKPOINT_RESTORE
4. Container will run and stop
5. Commit the container like

```
docker commit container-id new-tag
```

Pros and Cons

Pros:

1. Does not require arcane magic
2. Works more predictably
3. Does not depend on unstable features
4. Does not require privileged containers in

Cons:

1. Organization-specific
2. Requires more steps

And now we have all flavours of ultimate docker images!

Quick summary?

1. Use layers for faster deployment
2. Use CDS for faster startup without many compromises
3. Use CRaC for a *lightning-fast* startup (with compromises)

Thank you!
